Tidy Evaluation: Live Demo

Lionel Henry | RStudio

Takeaways

- Quoting works against you when you write functions
 - Easy to work with your data
 - But hard to program with variables

- Tidy eval provides full programmability
 - Set of tools included in dplyr, tidyr, and soon ggplot2, ...
 - Challenging at first but rewarding!
 - Two important concepts: quasiquotation (unquoting) and quosures

Takeaways — Quasiquotation

- !! operator
 - Refer to variables inside quoted expressions
 - Create complex expressions by expanding around !!
 - Bypass the data mask

- !!! Operator
 - Unquote any number of elements in a list

Takeaways — Quoting functions

- enquo()
 - Transform your function into a quoting function
 - Captures user input in a quosure

- Quosures
 - Annoying but necessary for robustness
 - They just work don't mind them
